Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions What does the customer do?	• Integrates historical regional weather records. • Connects real-time river gauge sensor streams. • Ensures clean data pipeline syncing.	• Evaluates localized storm cloud precipitation data. • Runs predictive analytics models for flash floods. • Maps risk probabilities for low-lying areas.	• Receives critical risk threshold warning indicators. • Triggers proactive citizen evacuation siren broadcasts. • Dispatches real-time area mapping to field units.
Touchpoint What part of the service do they interact with?	• Central data ingestion dashboard UI. • Cloud storage database logs. • Active sensor monitoring stream interfaces.	• Core ML analytics processing console • Live flood risk mapping graphs. • Local precipitation metrics evaluation panel.	• Emergency response control dispatch desk. • Local public broadcast broadcast utility. • Mobile warning notification server interface.

Customer Thought What is the customer thinking?	• Are all local sensor feeds live right now? • Is there any latency in data loading? • Will this manual integration source cause any delays?	• Will this model forecast accurately under pressure? • Can it give a clear 4-hour advance alert? • Are historical parameters matching current rainfall levels?	• Will alerts reach rural zones fast enough? • Are response teams dispatched to correct locations? • Did all automated notification flags process correctly?
Customer Feeling What is the customer feeling?	· Apprehensive about initial raw sensor metrics setup. · Hopeful for successful automated pipeline connections. · Focused on sorting initial validation errors.	· Anxious about algorithm output validation results. · Highly focused on active model precision tracking. · Responsible for checking unexpected data anomalies.	· Stressed due to critical time-sensitive operations. · Determined to coordinate error-free safe citizen exits. · Overwhelmed by high accountability during downpours.

Process Ownership Who is in the lead on this?	• Data Engineering Lead Team. • Cloud Infrastructure Operations Unit.	• AI Development Engineering Lead. • Core Analytics Science Team. • System Performance Evaluation Specialist.	• Emergency Management Operations Director. • Public Safety Dispatch Coordinator. • Local Field Response Logistics Team.
Opportunities	• Implement automated validation to filter noise.	• Train models on extreme regional weather anomalies	• Deploy automated fallback SMS systems immediately.
s	• Set up immediate alert flags for down sensors.	• Enable parallel processing to save runtime minutes.	• Integrate precise geo-fencing for target zone alerts.
How can we	• Optimize backend parsing for faster intake.	• Standardize data input formats for smooth scaling.	• Create quick dashboard buttons for direct relays.
improve this stage?
