

Problem-Solution Fit

Date	30 June 2026
Team ID	xxxxxx
Project Name	Rising Waters
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

Use the framework below to ensure your proposed solution accurately addresses the root causes, behaviors, and limitations of your target audience. Fill out the canvas in the respective boxes just like the original visual template.

1. CUSTOMER SEGMENT(S) [CS] - Government Disaster Management Authorities and Emergency Response Teams. - Municipal corporations and urban local bodies in flood-prone zones. - Local rescue volunteers and coastal emergency response coordinators.	6. CUSTOMER LIMITATIONS EG. BUDGET, DEVICES [CL] - Minimal tech budgets for high-end server installation or massive field networks. - Field responders rely on basic mobile devices with unstable internet settings. - Lack of trained in-house data analytics staff to parse complex ML parameters.	5. AVAILABLE SOLUTIONS PROS & CONS [AS] - Solution: Traditional manual meteorological charts and delayed satellite feeds. - Pros: Highly reliable for macro-level regional updates; long historical baseline data. - Cons: Extremely slow processing runtime; zero localized live alert capabilities.
2. PROBLEMS / PAINS + ITS FREQUENCY [PR] - Problem: Delayed flash flood alerts due to slow manual weather tracking data feeds. - Frequency: Highly frequent and continuous during the active peak monsoon seasons. - Pain: Inability to locate exact high-risk low-lying	9. PROBLEM ROOT / CAUSE [RC] - Absence of automated data parsing from live water level telemetry systems. - Heavy reliance on delayed macro weather models instead of local edge parameters. - Fragmented communications between	7. BEHAVIOR + ITS INTENSITY [BE] - Behavior: Constantly monitors multiple unlinked data spreadsheets simultaneously. - Intensity: Extreme and round-the-clock panic tracking during active monsoon weeks.

zones for target evacuations.	data hubs and on-field emergency execution units.	
3. TRIGGERS TO ACT [TR] · Sudden spikes in cloud precipitation and heavy regional downpours. · Rapid rise in river gauge sensor metrics reaching near-danger levels. · Receiving continuous automated data error flags from manual charts.	10. YOUR SOLUTION [SL] · An automated real-time smart flash flood predictive model analytics platform. · Delivers precise localized threat flags with a clear 4 to 6-hour advance window. · Instant automated emergency SMS and siren alerts triggered directly via cloud logs.	8. CHANNELS OF BEHAVIOR [CH] ONLINE: Checking official web portals, weather chat groups, and delayed database dashboards.
4. EMOTIONS BEFORE / AFTER [EM] · Before: Stressed, overwhelmed, and highly anxious about public safety failures. · After: Confident, relieved, and secured with clear proactive advance timelines.		OFFLINE: Monitoring physical area maps, coordinating via local walkie-talkies, and manual telephone reports.
